Aditya Goyal

WDD Final Project Write-Up

1. I created a keyframe for the quote on my homepage. Having text that is dynamic sharply increases the UI of any website, and I wanted to implement some of what we learned about animations from class. Yes, ultimately if I kept the text static and the same to the description above it, it would also fulfill my purpose. However, I think the KeyFrame animation adds to the over UI. I focused on a minimalistic approach when creating my website, but having elements like this one improve the overall viewing experience.

2. My second element is the hover for the icons on my about page. I was able to learn how to use fontawesome to link icons to my website, but I wanted to add another dimension to them. So, I used the pseudo elements we learned in class and applied a special hover effect that would magnify the icons and change the color.

3. My third element is also a hover pseudo element. However, this one I learned on my own and while it does fall under the same category as my previous point, this unique hover element that occurs when you hover underneath the navbar is a little bit more complex. I found some resources on W3 and other sites that taught me the pseudo element of after. This helps the overall UI experience.

***
[I was going to use Javascript to make the transitions from one page to another more smooth, but it got too confusing and did not have time.]
